

MULTIFARIOUS AUTHENTICATION TECHNIQUE

ABSTRACT

This project is based on a graphical password scheme. It can be viewed as a combination of passpoints, passfaces & Story. A password consists of one Click point per image for a sequence of images. The next image displayed is based on the previous click-point so users receive immediate implicit feedback as to whether they are on the correct path when logging in . Multifarious Authentication System offers both improved usability & security.

Users could quickly create & re-enter their passwords. Another feature of Multifarious Authentication System is the immediate implicit feedback telling the user whether their latest click point was correct.
